**286. SOXHLET EXTRACTION LIQUID DOWNWARD DISPLACEMENT**

In this heavy faced solvent is discharged from a condenser into the top of the solution to be extracted, the solvent in this instance sinks through the solution & both solvent & extract then return to the flask via a tube from the bottom to the extractor body.

**287. SOXHLET EXTRACTION LIQUID UPWARD DISPLACEMENT**

This method allows light face solvent to enter the bottom of solution containing the extract, on emerging from the distributor air ascends through the heavy phase extracting the dissolved component & both the solvent & the extract then flow back into the flask

**PTFE PRODUCT**

PTFE Laboratory ware and accessories are designed for use under the most severe laboratory condition. SSC has NW gained expertise in the techniques used in fabrication and fashioning PTFE laboratory ware. It has an unmatched combination of chemical inertness, heat resistance, Low temperature toughness and non-adhesive qualities.

**CHEMICALLY INERT:** PTFE products is completely inert to all concentrations of corrosive reagents as boiling aque regia hydorfluric, nitric and sulphuric acids-alkalies, boiling hydrocarbons, ketones, estors and alcohols. It's only at elevated temperature and pressure that molten alkalies metals and certain halogenated chemical have some effect.

**NON CONTAMINATING:** PTFE laboratory products are poresfree from any contamination, imparts no odour, does not support growth of bacteria or fungi.

**EASY TO CLEAN:** The unique anti-adhesive properties of PTFE resists adhesion of practically all materials. Even the stickiest substance are easily removed (cleaned) to the last drop.

**UNBREAKABLE:** PTFE cannot be cracked or chipped by thermal or mechanical shock and not subject to stress cracing. For its inherent toughness it is unbreakable even at low temperature.

**HEAT-COLD RESISTANCE:** PTFE can with stand high temperature upto 2600 down through cryogenic range to 2000 C.

**OFFERS ITS ADDED ADVANTAGE OF PTFE LABORATORY PRODUCTS OF EXTRA SMOOTH SURFACE-HIGH UNIFORM DENSITY - CLASSIC DESIGNS-EASY TO HANDLE.**

### FUSED SILICA QUARTZ GLASSWARE

In all Research and Development Institutions and modern Industries, it is all the same in any Laboratory, a certain range of Silica is required. **BENGAL** offers with its range a wide palette of products of Silica Glass which are required by any user. Silica is being described as quartz, quartz glass, fused quartz silica, fused silica etc. The High degree of ambiguity of the terms used for describing this material can be avoided by simply calling it "Silica Glass or Vitrous Silica" transparent or translucent which is sio<sub>2</sub> in glass form. The use of single word quartz is absolutely in correct as it refers to common crystalline form of silica found in nature.

There are only handful number of basic silica glass manufacturers in the world market, the reason being the complexity of manufacturing process of silica glass which demands sophisticated technology and availability of raw material of high purity. Since last five year our policy has been to offer best available material to our customers, therefore we insist on using best material in the market for fabrication of our silica glass items.

According to requirement we are able to offer the most suited kind of apparatus as we are in a position, both to fabricate an wide range of products due to our new technologies and to meet the wished of our customers for a good quality and large quantity.

#### TECHNICAL DETAILS:

Silica Glass i.e. silicium oxide (SiO<sub>2</sub>) is found on the earth in the form of quartz crystals or quartz sand. This material is converted into silica glass either transparent or translucent (opaque) depending on the raw material used and the process adopted for manufacturing. Translucent silica glass is made by melting very pure quartz sand. It's capacity is due to the presence of minute trapped air bubbles. Transparent silica is made by melting rock crystal under vacuum. This process eliminates entrapment of air bubbles in the melt. The other method of manufacturing optical quality silica transparent glass is by synthesis process.

Silica Glass, Transparent or Translucent possesses a unique range of properties. No other material has such a combination of perfectly blended characteristics.

#### CORROSION RESISTANT:

Transparent silica glass is more resistant to chemical attack than the non-transparent form, this is because the effect of bubbles in the latter provides a great surface area to etchant. At room temperature all forms can be considered to be completely unaffected by all acids except hydrofluoric. At high temperature slight corrosion occurs with aqueous solutions of High PH and also with phosphoric acid but the degree of corrosion does not preclude the use of silica with those reagents. Salts and basic oxides reacts at elevated temperatures particularly above their melting point. The extent of the reaction is largely determined by the thermal diffusion of impurities into silica of which ions of the alkalis metal have highest diffusivity.

#### CHEMICAL PURITIES:

Silica glass has impurity contents less than 1000 pm (0.1%wt) but transparent silica glass is more pure as its impurity is even lower than 100 pm (0.01%wt)

**LOW EXPANSION:**

Silica Glass remains insensitive to sudden variations of temperature. Rise of temperature causes no change of shape and of dimension.

**DIVERSIFICATION:**

Silica glass can be safely used upto 1000°C. Its behaviour above this temperature depends on various parameters. Prolonged heating above 1000°C leads to conversion from metastable phase of silica to stable crystalline phase. This transformation or recrystallisation is known as diversification and it occurs mainly at surface and less frequently at internal defects. Diversification is favoured by impurities above 1000°C on continuous use but is lower when the material is more pure and clean. Alkalies and particularly phosphores, borates and components of the alkaline earth metals promote Diversification. This points should be remembered when silica glass is being used at high temperature reactor vessels or as refractory material in high temperature furnaces.

**GASEOUS AND IONIC DIFFUSION:**

The structure of silica glass is fairly open and at high temperature this allows the diffusion of some gases and ions through the network. Sodium has the highest mobility.

**EXCELLENT ELECTRICAL INSULATION:**

The principal electrical advantage of silica glass are high dielectrical field strength, low electric conductivity and low die-electrical losses even at high temperature. Transparent Silica Glass is highly recommended for high frequency at high voltage insulators especially when the parties are exposed to high temperature and powerful mechanical stresses.

**NUCLEAR APPLICATION:**

Silica glass with stand Nuclear radiation very well particularly neutron and gamma rays Contrary to most other material and is now frequently employed in nuclear experiments in reactor and glove box chamber.

**OPTICAL CHARACTERISTICS:**

In contrary to ordinary type of silicate glass transparent silica glass is distinguished by the exceptionally good optical transmission in all wavelengths. In IR (infra red) range apart from some special IR type of Glass, transmission and spectral transmission range area greater than with ordinary glass. Invisible range, transparent silica glass is more transparent. It is far better than all other glass in transmission. In UV (ultra violet) range and particularly in the short wave UV Range the optical characteristics of transparent silica Glass are very dependent on its chemical purity generally it is transparent to ultra range upto 200mm (2000A).

**MECHANICAL STRENGTH:**

For designing hollow ware in silica glass the strength quoted by manufacture are of the order 35kg/cm<sup>2</sup> and for plates and thin discs these figures are 48 kg/cm<sup>2</sup> and 78kg/cm<sup>2</sup> respectively.

**THERMAL PROPERTIES:**

Maximum working temperature continuous	1100°C
Maximum working temperature short term	1300°C
Softening Point	1600°C
Annealing Point	1120°C

NOTE: \* Erection to be done at your end only.  
\* We do not guarantee life of Heater.

**407** Heating mantles are made of lid steel to accommodate several sizes of round bottom flasks and to provide uniform heating. Heating surface is made from fibre glass yarn, which has extra strength and longer life compared to asbestos surfaces. Bigger size of mantle have two or three heating circuit so that upper circuit could be switched off when lower part of flask is being heated or when liquid level drops. These mantles provide maximum surface temperature of 450 degree C working on 230 volts AC single phase.

**408. DESICCATORS NON-VACUUM HARD BOROSILICATE GLASS**

Used for storage of hydrogeoscopic corrosive & oxidising material or metallurgical chemical & biological specimens.

It has 2 parts of a chamber and a lid the flange of both parts are well ground to form a leak free sliding seal. The upper portion has 2 compartments, upper portion is used for storage of materials or specimen and its lower portion is used to load dehydrated active silica gel or any suitable desiccant which absorbs water vapour readily and maintains chamber atmosphere at low humidity level.
